EXTERIOR INSECT PREPARATION SHEET

To enable our Pest Management Professional to apply an effective treatment, we ask for your co-operation in carrying out the following instructions.

Pre-treatment

1. Neighbors on either side and in some cases across the back should be notified of the pesticide treatment on your property at least a day before so they are aware of the upcoming pesticide treatment.
2. Close all windows and doors.
3. Turn off air conditioning units and close vents to circulate indoor air before spraying begins.
4. Cover outdoor furniture and play equipment.
5. Bring laundry, toys, and pets indoors before spraying begins.
6. Cover swimming pool surfaces when it's possible and feasible.
7. Cover ornamental fishponds to avoid direct exposure.
8. Children and pets should be kept indoors until the area is dry.

During Treatment

1. Whenever possible, remain indoors during and immediately after treatment. We will not treat if it is too windy or if it is raining.
2. Treatment will usually occur in the early morning or early evening, weather and conditions permitting.
3. If you come in direct contact with concentrated pesticide product spray, protect yourself immediately and remove yourself from the treatment area.
4. If you get pesticide spray in your eyes or on your skin, immediately wash and rinse them with water.
5. Wash clothes that come in direct contact with pesticide sprays separately from other laundry.

Post-treatment

1. Do not enter the treated areas until the product has dried completely including keeping pets off of the treated areas.
2. As an additional protective post exposure step, wash down any toys, swings and other items which you may handle by rinsing them off with water after spraying is finished and after the pesticide product has dried.
3. Wash homegrown fruit and vegetables with water before cooking or eating them.
